Allowance

1. The following is the Examiner's statement of reasons for allowance:

Claim 1 of the instant invention claims a process for controlling a continuous gas phase exothermic process in a reactor comprising: (i) affecting a gas phase exothermic reaction in the presence of a cooling agent, (ii) determining a maximum production rate without the limitations due to the cooling agent, (iii) determining the maximum production rate with regard to limitations due to the cooling agent, (iv) calculating an optimal concentration of the induced cooling agent such that the difference between the previously determined production rates is minimized, and (v) adjusting the feed rate of the induced cooling agent to achieve the concentration value calculated in step (iv), wherein the cooling agent comprises reactants, inerts, and the induced cooling agent.

The prior art of record neither anticipate nor render obvious the subject matter as claim in the application:

- Jenkins, III et al. (US Pat. No. 4,588,790) discloses increasing space-time-yield, or production yield, by adjusting the concentration of condensable fluids in the recycle stream [column 2, line 68] up to 20 weight percent of the recycle stream [column 6, lines 42-43], particularly using isopentane as an inert fluid [column 19, lines 12-13].
- DeChellis et al. (US Pat. No. 5,352,749) discloses a method of increasing reactor productivity by increasing the condensed liquid in

a recycle stream to 25-50 weight percent [column 12], also using isopentane as the cooling fluid [column 15, line 59], such that the enthalpy change of the fluidizing medium or recycle stream exiting and entering the reactor is greater than 40 Btu/lb [column 4, lines 45-47].

- Bernier et al. (US Pat. No. 5,834,571) discloses a method for improving the efficiency of monomer conversion [column 3, lines 52-53] by providing better heat control with a "Liquid Component" [column 3, lines 47-48]. The "Liquid Component" is utilized in an amount or concentration such that its calculated dew point in the fluidizing gases is within about 2 to 5°C of the average bulk temperature of the reaction zone [columns 7-8].

The references above, taken individually or collectively, do not disclose or adequately suggest determining the amount of cooling agent by minimizing the difference between production rates with and without regard to the limitations due to the cooling agent.

Any comments considered necessary by the Applicants must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
